Lesson 1

Decimals to the Thousandths Place

Remember

The whole one can be divided into

Ten equal parts	**One hundred equal parts**	**One thousand equal parts**
Each part is called **one tenth.**	Each part is called **one hundredth.**	Each part is called **one thousandth.**
$0.1 = \dfrac{1}{10}$	$0.01 = \dfrac{1}{100}$	$0.001 = \dfrac{1}{1,000}$

Note that: In decimals, zeros can be added to the **right** of the last non-zero digit without changing the value of the number.

0.1	**0.10**	**0.100**
(One tenth)	(Ten hundredths)	(One hundred thousandths)

= =
Also: $0.2 = 0.20 = 0.200$, $0.3 = 0.30 = 0.300$,... and so on.

Decimals

- A decimal is a number that consists of both a whole number and a fractional part.
- Decimal numbers lie between integers and represent numerical values for quantities that are whole plus some part of a whole.

Whole number part (integer)
To the **left** of the decimal point

Fractional part
To the **right** of the decimal point

357 . 94

It's read as: Three hundred fifty-seven **and** ninety-four hundredths.

Reading Numbers from One Milliard to Thousandths

Learn To read any decimal:

- Divide the whole number into numerical groups according to the place value table.
- Read the number from the **left**, each number group is followed by its name, separate the integer and the decimal with the word (and).
- Read the fractional parts followed by the name of the **last decimal part** on the **right.** (according to the number of decimal places)

Whole Number										Decimal Point	Decimals		
Milliards	Millions			Thousands			Ones				Tenths	Hundredths	Thousandths
Ones	Hundreds	Tens	Ones	Hundreds	Tens	Ones	Hundreds	Tens	Ones

Place Value Shuffle
Composing and Decomposing Decimals

Lessons 2&3

Learn The value of the digit changes within the number by changing its place.

Ex.

	Thousands		Hundreds				Tenths	Hundredths	
5	4	,	4	2	3	.	4	4	7

X 10   X 10

| Value | 4,000 | 400 | | 0.4 | 0.04 |

÷ 10   ÷ 10

From above The value of the digit:

- Increases by 10 times (X 10) as it moves to the **left**.
- Decreases by 10 times (÷10) as it moves to the **right**.

Learn Using the place value charts to solve multiplying and dividing by 10 problems

Ex. Use the place value chart to solve the following problem:

75.4 x 10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
				7	5	.	4		
			7	5	4				

- The value of (7) increased when multiplying by 10 from (70) to (700)
- The value of (5) increased when multiplying by 10 from (5) to (50)
- The value of (4) increased when multiplying by 10 from (0.4) to (4)

75.4   754

Therefore:

The value of the whole number 75.4 increased when multiplying by 10 from 75.4 to 754. **So, 75.4 X 10 = 754.**

1 Use the place value charts to solve the following problems.

Fill in the blanks to show how the value of each digit has changed:

ⓐ 386 X 10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
			3	8	6	.			
		3	8	6	0	.			

- The value of **6** (increased/decreased) when multiplying by **10** from **6** to **60** .

- The value of **8** (increased/decreased) when multiplying by **10** from **80** to **800**.

- The value of **3** (increased/decreased) when multiplying by **10** from **300** to **3,000** .

- Therefore, the value of the whole number **386** (increased/decreased) when multiplying by **10** from **386** to **3,860** . So, **386 X 10** = **3,860** .

ⓑ 2.5 X 10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
					2	.	5		
				2	5	.			

- The value of **5** (increased/decreased) when multiplying by **10** from **0.5** to **5** .

- The value of **2** (increased/decreased) when multiplying by **10** from **2** to **20** .

- Therefore, the value of the whole number **2.5** (increased/decreased) when multiplying by **10** from **2.5** to **25** . So, **2.5 X 10** = **25** .

EX. **Use the place value chart to solve the following problem:**

$$75.4 \div 10 = 7.54$$

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
				7	5	.	4		
					7	.	5	4	

- The value of 7 decreased when dividing by 10 from 70 to 7
- The value of 5 decreased when dividing by 10 from 5 to 0.5
- The value of 4 decreased when dividing by 10 from 0.4 to 0.04

75.4   7.54

Therefore:

The value of the whole number 75.4 decreased by a factor of 10 from 75.4 to 7.54. So, 75.4 ÷ 10 = 7.54.

2 **Use the place value charts to solve the following problems.**
Fill in the blanks to show how the value of each digit has changed:

ⓐ 915 ÷ 10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
			9	1	5	.			
				9	1	.	5		

- The value of ___5___ (increased/decreased) when dividing by **10** from
  5 ... to 0.5 .
- The value of ___1___ (increased/decreased) when dividing by **10** from
  10 ... to ... 1 .
- The value of ___9___ (increased/decreased) when dividing by **10** from
  900 .. to 90 .
- Therefore, the value of the whole number 915 (increased/decreased) when dividing by **10** from 915 to 91.5 . So, 915 ÷ 10 = 91.5 .

ⓑ 8.7 ÷ 10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
					8	.	7		
					0	.	8	7	

- The value of __7__ (increased/~~decreased~~) when dividing by **10** from __0.7__ to __0.07__ .

- The value of __8__ (increased/~~decreased~~) when dividing by **10** from __8__ to __0.8__ .

- Therefore, the value of the whole number __8.7__ (increased/~~decreased~~) when dividing by **10** from __8.7__ to __0.87__ . So, 8.7 ÷ 10 = __0.87__ .

Notes:

- When multiplying by **10**, move all digits of the number one place to the **left**.
- When dividing by **10**, move all digits of the number one place to the **right**.

3 Find the result:

ⓐ 75.65 x 10 = ... **756.5**

ⓑ 83.19 ÷ 10 = ... **8.319**

ⓒ 3.587 X 10 = ... **35.87**

ⓓ 952.4 ÷ 10 = ... **95.24**

ⓔ 254 X 10 = ... **2,540**

ⓕ 360 ÷ 10 = ... **36**

Rounding Decimals

To the Nearest

1 Whole Number	2 Tenth	3 Hundredth	4 Thousandth
Unit	One decimal place	Two decimal places	Three decimal places
Ones	$0.1 - \dfrac{1}{10}$	$0.01 - \dfrac{1}{100}$	$0.001 - \dfrac{1}{1,000}$

Rounding Strategies

First **The Midpoint Strategy:**

Ex. Round each of the following numbers:

ⓐ **24.7** (To the nearest whole number)

- The number **24.7** is located between the numbers **24.0** and **25.0**.
- The midpoint between the two numbers is **24.5**.
- **24.7** is closer to **25.0**.

So: $24.7 \approx 25$ (To the nearest whole number)

25.0 — Closer
24.7
24.5
Midpoint — farther
24.0

ⓑ **3.74** (To the nearest tenth)

- The number **3.74** is located between the numbers **3.70** and **3.80**.
- The midpoint between the two numbers is **3.75**.
- **3.74** is closer to **3.70**.

So: $3.74 \approx 3.7$ (To the nearest Tenth)

3.80 — farther
Midpoint
3.75
3.74 — Closer
3.70
c 45.648 (To the nearest Hundredth)

- The number **45.648** is located between the numbers **45.640** and **45.650**.
- The midpoint between the two numbers is **45.645**.
- **45.648** is closer to **45.650**.

So: 45.648 ≈ 45.65 (To the nearest Hundredth)

45 650 — Closer
45.648
45.645

45 640 — farther
d 2.3175 (To the nearest Thousandth)

- The number **2.3175** is located between the numbers **2.3170** and **2.3180**.
- The midpoint between the two numbers is **2.3175**.
- **2.3175** is located at the midpoint.

**So:** 2.3175 ≈ 2.318 (To the nearest Thousandth)

Second **Rounding Rule Strategy:**

Ex. **Round the following numbers:**

ⓐ $9.675 \approx$ (To the nearest whole number)

ⓑ $6.24 \approx$ (To the nearest Tenth)

ⓒ $56.839 \approx$ (To the nearest Hundredth)

ⓓ $2.3565 \approx$ (To the nearest Thousandth)

Answer:

① Select the digit in the place to be rounded.

ⓐ	ⓑ	ⓒ	ⓓ
⑨. 6 7 5	6 . ② 4	5 6 . 8 ③ 9	2 . 3 5 ⑥ 5

② Replace the digits in the places that precede the previously selected digit with **zeros**.

ⓐ	ⓑ	ⓒ	ⓓ
⑨. 6 7 5	6 . ② 4	5 6 . 8 ③ 9	2 . 3 5 ⑥ 5

③ Look at the digit in the place preceding the place to be rounded directly.

If this digit is **0, 1, 2, 3**, or **4**, the number of the specified place remains **unchanged**.

If this digit is **5, 6, 7, 8** or **9**, we **add 1** to the number of the specified place.

Ex. **Round the following numbers to the nearest:**

ⓐ $+1$	ⓑ	ⓒ $+1$	ⓓ $+1$
9 . 6 ⑦ 5	6 . ② 4	5 6 . 8 ③ 9	2 . 3 5 ⑥ 5
10 . 0 0 0	6 . 2 0	5 6 . 8 4 0	2 . 3 5 7 0
$9.675 \approx 10$	$6.24 \approx 6.2$	$56.839 \approx 56.84$	$2.3565 \approx 2.357$
(Whole number)	**(Tenth)**	**(Hundredth)**	**(Thousandth)**

4 Round each of the following numbers:

(a) $753.5 \approx$ **754**   (To the nearest whole number)

(b) $56.25 \approx$ .... **56.3** ....   (To the nearest Tenth)

(c) $63.78 \approx$ ...... **60** ......   (To the nearest Ten)

(e) $956.285 \approx$ **1,000**   (To the nearest Hundred)

(f) $0.0396 \approx$ **0.04**   (To the nearest Thousandth)

5 Fill in the chart as you round each decimal to the stated place value:

	Number	Round to the Nearest Whole Number	Round to the Nearest Tenth	Round to the Nearest Hundredth
(a)	56.284	56	56.3	56.28
(b)	572.089	572	572.1	572.09

Lesson 6&7
Estimating Decimal Sums
Modeling Decimal Addition

Learn **Estimating the Sum of Decimals**

1 Benchmark Strategy:

The numbers (0, 0.5, and 1) are benchmark numbers.
Note the following number line:

0.01 0.25 **0.50** 0.75 **0.99**

0 — 0.1 — 0.2 — 0.3 — 0.4 — (0.5) — 0.6 — 0.7 — 0.8 — 0.9 — 1
There are decimals close to zero (0.1 , 0.01 , 0.001 …)	There are decimals close to 0.5 (0.25 , 0.622 0.51 …)	There are decimals close to the whole one (0.75 , 0.99 , 0.999 …)

Ex. Estimate the sum of the following using benchmark decimals:

ⓐ

$$0.65 + 0.456$$

$$0.5 + 0.5 = 1$$

0.65 is close to 0.5
0.456 is close to 0.5

ⓑ

$$0.001 + 0.98$$

$$0 + 1 = 1$$

0.001 is close to 0
0.98 is close to 1

ⓒ

$$0.55 + 0.9$$

$$0.5 + 1 = 1.5$$

0.55 is close to 0.5
0.9 is close to 1

1 Estimate the sum of the following decimals using benchmark decimals:

ⓐ 0.89 + 0.533 ⟶ Estimate: .... **1** .... + ... **0.5** .... = ... **1.5** ....

ⓑ 0.42 + 0.03 ⟶ Estimate: ...... **0.5** ...... + ... **0** ...... = ... **0.5** ......

ⓒ 0.612 + 0.021 ⟶ Estimate: ...... **0.5** ...... + ... **0** ...... = ... **0.5** ......

ⓓ 0.55 + 0.482 ⟶ Estimate: ...... **0.5** ...... + ... **0.5** ...... = ... **1** ......

Ex.

a

75.15 + 21.95

= 75 + 0.15 + 21 + 0.95

75 + 0 + 21 + 1

= 97

0.15 is close to 0

0.95 is close to 1

b

32.987 + 15.482

= 32 + 0.987 + 15 + 0.482

32 + 1 + 15 + 0.5

= 48.5

0.987 is close to 1

0.482 is close to 0.5

Note.
- We can separate whole and parts before using benchmark decimals.

2 **Estimate the following sums (Using Benchmark Decimals):**

a 5.95 + 21.002 = ... 5 ... + 0.95 + ... 21 + 0.002

⟶ ... 5 .... + ... 1.... + ... 21 ... + ... 0 .... = ... 27

b 6.552 + 82.495 = 6 + 0.552 + 82 + 0.495

⟶ . 6 .. + 0.5 + . 82 . + .. 0.5 = 89

c 12.954 + 3.45 = . 12 .. + 0.954 + .. 3 . + 0.45

⟶ ... 12 .... + ... 1.... + ... 3 ... + . 0.5 ... = 16.5

2 Rounding Strategy:

Ex. Estimate the sum 23.845 + 58.538 using rounding strategy:

23.85 + 58.54 = 82.39 (To the nearest Hundredths)

23.845 + 58.538 — 23.8 + 58.5 = 82.3 (To the nearest Tenths)

24 + 59 = 83 (To the nearest Ones)

20 + 60 = 80 (To the nearest Tens)

The actual sum: 23.845 + 58.538 = 82.383

Note.
- Rounding to the lowest place value is the closest estimate to the actual sum.

3 **Estimate the sum of the following decimals (Using Rounding Strategy):**

    ⓐ 2.3 + 3.7   ⟶ Estimate: 2   +   4   =   6

    ⓑ 3.451 + 8.091   ⟶ Estimate: 3.45 + 8.09 = 11.54

    ⓒ 9.98 + 4.56   ⟶ Estimate: 10   + 4.6 = 14.6

    ⓓ 4.9817 + 5.0192 ⟶ Estimate: 4.982 + 5.019 = 10.001

4 Taha has 54.26 LE. His brother has 45.75 LE. They want to combine their money to purchase 4 kilograms of apples for 100 LE. Estimate to see if they have enough money.

<div align="center">

Estimate: 54 + 46 = 100

Yes, they have enough money.

</div>

Using Letters or Symbols to Represent Unknown Values in Mathematical Expressions and Equations

Ex.

Yassin bought a pen and a ruler. He paid 14.5 pounds for them.
If the price of the pen is 6.25 pounds, what is the price of the ruler?

Write an equation to represent the price of the ruler.

The previous example can be expressed as follows:

| The price of the pen | **+** | The price of the ruler | **=** | What Yassin paid |
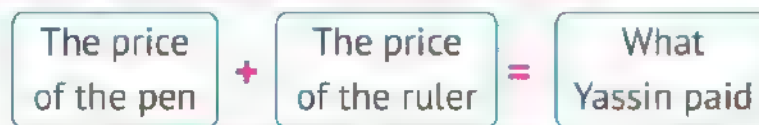

What Yassin paid = 14.5 pounds.
The price of the pen = 6.25 pounds.
The price of the ruler is unknown.

$$6.25 + unknown = 14.5$$

- Replace the word unknown with one of the letters (a variable) "y".
- So, the equation that represents the price of the ruler is:

$$6.25 + y = 14.5 \quad or \quad y = 14.5 - 6.25$$

2 Read the following story problems. Make an equation for each problem:

ⓐ Ahmed had 25.15 pounds, and he bought a toy for 14.5 pounds.
How much money is left with Ahmed?

$$w = 25.15 - 14.5$$
$$w = 10.65$$

ⓑ A class in a school has 45 students. 28 of them are girls.
How many boys are there in this class?

$$y = 45 - 28$$
$$y = 17$$

© A farm had **4,200** chickens. **3,350** chickens were sold in a week.
How many chickens are left on the farm?

$$m = 4,200 - 3,350$$

$$m = 850$$

ⓓ Ahmed bought a car for **90,990** pounds and bought a house for his family for **750,250** pounds.
How much did Ahmed spend to buy the car and the house?

$$a = 750,250 + 90,990$$

$$a = 841,240$$

Determining the Value of the Unknown

You can use mental math to determine the value of the (unknown) variable in the equation.

Ex. Find the value of (a) in each of the following:

$0.5 + a = 0.9$	$a + 0.2 = 1.7$	$8.5 - a = 2.3$	$a - 2.4 = 3.5$
$a = 0.9 - 0.5$	$a = 1.7 - 0.2$	$a = 8.5 - 2.3$	$a = 2.4 + 3.5$
$a = 0.4$	$a = 1.5$	$a = 6.2$	$a = 5.9$

1 Use mental math to estimate the equations, and then solve them:

ⓐ $8.235 + p = 10.224$

$p = $ .... $10.224 - 8.235$ ....

$p = $ .... 1.989 ....

ⓑ $t - 2.445 = 0.26$

$t = $ .... $2.445 + 0.26$

$t = $ 2.705

ⓒ $6.82 - h = 1.023$

$h = $ .... $6.82 - 1.023$ ....

$h = $ .... 5.797 ....

ⓓ $v + 42.809 = 100.01$

$v = $ .... $100.01 - 42.809$

$v = $ 57.201

ⓔ $5.52 + 2.041 + m = 9.271$

$m = $ $9.271 - (5.52 + 2.041)$ ....

$m = 9.271 - 7.561$., $m = 1.71$..

ⓕ $2.377 + 3.1 = 1.52 + a$

$a = $ .... $5.477 - 1.52$

$a = $ 3.957

Ex.

Write a story problem for the following equation, then solve it:

$$53.5 + m = 92.7$$

Answer

Bassem takes the bus from Cairo to Tanta. The distance is 92.7 km. The bus stops 53.5 km away in the city of Banha to take more passengers. How far is Banha from Tanta?

$$53.5 + m = 92.7 \text{ Then } m = 92.7 - 53.5$$

$$m = 39.2$$

(The distance is 39.2 km)

2 Write a story problem representing each equation, and then solve it:

ⓐ $x + 2.75 = 12.5$

Mark bought a pen for 2.75 L.E and bought a pencil. if Mark paid

12.5 L.E, What is the price of pencil

Omnia has two strips of cloth. One is 35 cm wide, and the other is 75 cm wide. She wants to cut both pieces into strips of equal width that are as wide as possible. How wide should she cut the strips?

(In this example, Omnia wants to divide the cloth into pieces, so we use the GCF in the solution)

Solution:
$35 = 5 \times 7$
$75 = 5 \times 5 \times 3$
GCF = 5

The largest width of the strips = 5 cm.

Ex.

Mohamed trains to walk every 7 days and lift weights every 4 days, he did both today. After how many days will Mohamed walk and lift weights on the same day?

(In this example, there is a repetition of what Mohamed does, so we use the LCM in the solution)

Solution:
Multiples of 7: 0, 7, 14, 21, 28, 35, 42, ...
Multiples of 4: 0, 4, 8, 12, 16, 20, 24, 28, 32 ....
LCM = 28

Mohamed will do both exercises after 28 days.

2 Omar exercises every 12 days. Rana exercises every 8 days.
Both friends exercised together today.
How many days will it be until they exercise together again?

LCM = 24 days.

3 Malak baked 30 servings of cakes and 48 servings of baklava for her family. She wants to divide the desserts into containers, so that each person receives the same number of servings. How many containers will she need?

GCF = 6 containers

Lesson 1 — Using the Area Model to Multiply

Using the Rectangle Area Model to Multiply a Two-Digit Number by a Two-Digit Number

Ex.

Multiply: 36 X 42

• Create the following rectangle.	• Expand the first number: 36 = 30 + 6 • Then, the second number: 42 = 40 + 2	• Multiply the rows and columns as shown. • Add the products of the multiplication.

X

X	30	6

36

X	30	6
40	40 X 30 = 1,200	40 X 6 = 240
2	2X30 = 60	2X6 = 12

42

So, 36 X 42 = 1,200 + 240 + 60 + 12 = 1,512

Ex.

Multiply: 69 X 427

So 69 X 427
= 24,000 + 1,200 + 420
+ 3,600 + 180 + 63

4 Find the product using the Distribution Property:

ⓐ 93 X 24 = (**90** + **3**) X (**20** + **4**)

= (90 X 20) + (90 X **4**) + (**3** X 20) + (3 X **4**)

= **1,800** + **360** + **60** + **12** = **2,232**

ⓑ 72 X 103 = (**70** + **2**) X (**100** + **3**)

= (70 X 100) + (70 X **3**) + (**2** X 100) + (2 X 3)

= **7,000** + **210** + **200** + **6** = **7,416**

ⓒ 52 X 214 = (**50** + **2**) X (**200** + **10** + **4**)

= (50 X 200) + (50 X 10) + (50 X 4)

+ (**2** X **200**) + (**2** X **10**) + (**2** X **4**)

= 10,000 + **500** + **200** + **400** + **20** + **8** = 11,128

ⓓ 82 X 107 = (80 + 2) X (100 + 7)

= (80 X 100) + (80 X 7) + (2 X 100) + (2 X 7)

= 8,000 + 560 + 200 + 14 = 8,774

6 Answer the following:

a Mona has a restaurant in Al-Quesyr. In February, Mona sold **402** kebabs. In March, she sold **753** kebabs. She makes each kebab with **83** grams of meat. How many grams of meat did she use in February and March?

753 + 402 = 1,155 kebabs,

1,155 X 83 = 95,865 g

ⓑ Mona's son, Wael, makes baklava to sell at his family's restaurant. His recipe calls for 170 grams each of pistachios, walnuts, and hazelnuts. In order to make enough for the customers, he needs to multiply his recipe by 18. How many total grams of nuts will he need?

$$170 \times 3 \times 18 = 9{,}180 \text{ g}$$

ⓒ For Wael's baklava syrup, he needs 250 milliliters of honey, 15 mL of orange extract, and 30 mL of lemon juice per recipe. How many total milliliters of liquid ingredients will he need for the syrup if he needs to make 18 batches?

$$250 + 15 + 30 = 295 \text{ mL}$$
$$295 \times 18 = 5{,}310 \text{ mL}$$

Using the Area Model to Divide

Ex. Divide: 753 ÷ 6

1

Draw a rectangle and write the divisor (6) on the left side of the rectangle.

- We look for a multiple of **6**, close to **753**.
- We find that **600** is a multiple of **6**; because **600 = 6 X 100**.
- We write **100** over one part of the rectangle, and we write **753 − 600 = 153** inside it.

2

6	753 − 600 153	153 − 120 33	33 − 30 3	3 Remainder

753 ÷ 6 = 125 (R 3)

- To find the quotient, we add the numbers above the rectangle:

Lesson 3-5

Using the Division Algorithm
The Relation Between Division and Multiplication
Multistep Story Problems

Remember

Using the Standard Algorithm to Divide

Ex. Divide: $891 \div 3$

The steps of the division process:

First Step: Divide	Second Step: Multiply	Third Step: Subtract	Fourth Step: Drop the next digit

$$\begin{array}{r} 2 \\ 3\,\overline{)891} \end{array}$$

$$\begin{array}{r} \times\;2 \\ 3\,\overline{)891} \\ 6 \end{array}$$

$$\begin{array}{r} 2 \\ 3\,\overline{)891} \\ -6 \\ \hline 2 \end{array}$$

$$\begin{array}{r} 2 \\ 3\,\overline{)891} \\ -6 \\ \hline 29 \end{array}$$

● **We repeat the same steps**

Divide: $29 \div 3$

Multiply: 9×3

Subtract: $29 - 27$

Drop the digit: 1

$$\begin{array}{r} 29 \\ 3\,\overline{)891} \\ -6 \\ \hline 29 \\ -27 \\ \hline 21 \end{array}$$

Divide: $21 \div 3$

Multiply: 7×3

Subtract: $21 - 21$

$$\begin{array}{r} 297 \\ 3\,\overline{)891} \\ -6 \\ \hline 29 \\ -27 \\ \hline 21 \\ -21 \\ \hline 0 \end{array}$$

So, $891 \div 3 = 297$

Note that Multiplication and division are inverse operations, so we can use multiplication to check the result of division.

From the previous example:

$297 \times 3 = 891$, where the product of multiplication is equal to the dividend, **so** the quotient is true.

Ex.

Divide: 859 ÷ 8

(Using the standard division algorithm)

- **Note that:** When dividing $5 \div 8$, division is **not possible** because $5 < 8$.

So: We put **0** over the digit **5**, and we divide **5** and **9** together: $59 \div 8$.

Then: $859 \div 8 = 107 \ (R \ 3)$

Check: $(107 \times 8) + 3 = 859$

$$5 \div 8 \text{ Not possible}$$
$$8 \div 8 = 1 \qquad 56 \div 8 = 7$$

Dividing by a Two-Digit Number Using the Standard Division Algorithm

Create a multiplication table for the divisor to help you:

$46 \times 1 = 46$

$46 \times 2 = 92$

$46 \times 3 = 138$

$46 \times 4 = 184$

$46 \times 5 = 230$

$46 \times 7 = 322$

1 Starting from the left, we find that:

$9 < 46$, so we divide $99 \div 64$.

With the help of the previous table, we find that:

The nearest multiple of 46 to **99** is $46 \times 2 = 92$.

```
        0 2 1 7
  46 | 9 , 9 8 2

          7 8
        -   4 6
            3 2 2

So: $9{,}982 \div 46 = 217$

Check: $217 \times 46 = 9{,}982$

(b) Computer Depot sold 762 reams of paper. Paper Palace sold 3 times as much paper as Computer Depot and 143 reams more than Office Supply Central. How many reams of paper were sold by all three stores combined?

Paper Palace = 3 X 762 = 2,286 reams

Office Supply   = 2,286 – 143 = 2,143 reams

Sum = 762 + 2,286 + 2,143 = 5,191 reams

(c) Hazem has 5 boxes of red pens, each with 24 pens, and 4 boxes of blue pens, each with 12 pens.

Hazem wants to distribute the pens evenly among 8 of his friends.

How many pencils will each friend get?

Red = 5 X 24 = 120 pens

blue = 4 X 12 = 48 pens

Each friend will get = (120 + 48) ÷ 8

= 168 ÷ 8 = 21 pens

Multiplying by Powers of Ten
Multiplying Decimals by Whole Numbers

Notes:

• You can add **zeros** to the left of the last non-zero digit, or add a **decimal point** to the whole number, or add **zeros** to the right of the decimal point without changing the value of the number.

Ex.

$$0008 = 008 = 08 = 8 = 8.0 = 8.00 = 8.000$$

Multiplying by (10, 100, 1,000,...)

$8.0_∧ \times 10 = 80$

$8.0_∧0_∧ \times 100 = 800$

$8.0_∧0_∧0_∧ \times 1,000 = 8,000$

When multiplying by 10, 100, or 1,000, move the decimal point to the **right** with the same number of **zeros**.

$3.4_∧5 \times 10 = 34.5$

$3.4_∧5_∧ \times 100 = 345$

$3.4_∧5_∧ {}_∧\times 1,000 = 3,450$

Multiplying by (0.1, 0.01, 0.001,...)

$_∧8. \times 0.1 = 0.8$

$_∧{}_∧8. \times 0.01 = 0.08$

$_∧ {}_∧ {}_∧8. \times 0.001 = 0.008$

When multiplying by 0.1, 0.01, or 0.001, move the decimal point to the **left** by the same number of **decimal parts**.

$2_∧1.7 \times 0.1 = 2.17$

$_∧2_∧1.7 \times 0.01 = 0.217$

$_∧2_∧1.7 \times 0.001 = 0.0217$

The place of the whole number cannot be left blank, a "0" is added to save its place.

- Note the following examples:

12,000 ← 1,000 X			X 0.1 →	1.2

Using the Standard Algorithm to Multiply Decimals

Ex. Multiply: ⓐ 32.5 X 7.3   ⓑ 3.25 X 7.3
ⓒ 3.25 X 73   ⓓ 32.5 X 73

- Multiply the **two numbers** without the decimals.
- Put the decimal point in the result from the **right**, after the number of digits equal to the sum of the decimal places in the two numbers before the multiplication.

$$
\begin{array}{r}
\overset{13}{\overset{1}{3\,2\,5}} \\
\times \quad 73 \\
\hline
975 \\
+ \quad 22.750 \\
\hline
23.725
\end{array}
$$

ⓐ   32.5   X   7.3   =   237.25

| 1 Decimal Place | 1 Decimal Place | = | 2 Decimal Places |

ⓑ   3.25   X   7.3   =   23.725

| 2 Decimal Places | 1 Decimal Place | = | 3 Decimal Places |

ⓒ   3.25   X   73   =   237.25

| 2 Decimal Places | No Decimal Places | = | 2 Decimal Places |

ⓓ   32.5   X   73   =   2372.5

| 1 Decimal Place | No Decimal Places | = | 1 Decimal Place |

Notes:

- If the number of digits of the product is **less than** the sum of the number of decimal places, add **zeros** by the amount of increment to the **left** of the resulting number, and then put the decimal point.

Ex.   0.04   X   0.2   =   0.008

| 2 Decimal Places | 1 Decimal Place | = | 3 Decimal Places |

4 X 2 = 8, the product of multiplication is one digit, and we need 3 digits, so we add two **zeros** and then put the decimal point.

1 If **24 X 13 = 312**, then complete:

(a) 2.4 X 13   = ... **31.2** ....   (b) 24 X 1.3   = ... **31.2**

(e) 2.4 X 0.13 =   **0.312**   (f) 2.4 X 130   =   **312**

(g) 0. 24 X 13 =   **3.12**   (h) 0.24 X 0.13 =   **0.0312**

2 In each of the following, put a decimal point in the product:

(a) 3.6 X 4.1   = 14.76   (b) 8.7 X 52   = 452.4

(c) 1.25 X 3.7   = 4.625   (d) 7.74 X 23   = 178.02

(e) 92.3 X 0.08   = 7.384   (f) 183 X 0.06   = 10.98

(g) 75.63 X 0.14 = 10.5882   (h) 2.008 X 42   = 84.336

3 Use the standard algorithm to multiply:

3.5	7.6	2.31	7.23
X 0.7	X 3.4	X 1.4	X 0.12

ⓒ Ehab wants to know how much he has grown this year. In January, he was 138.2 centimeters. By the end of the year, he was 1.5 meters tall. How much did Ehab grow this year? (In centimeters)

Ehab grew = 150 – 138.2 = 11.8 cm

ⓓ Marwan is designing a new circuit board for the computer he is repairing. The old circuit board measured 7.25 centimeters by 36 millimeters. He planned for the new circuit board to be 80 mm by 5.5 cm. What is the difference in area of the circuit boards? (In centimeters)

3.6 X 7.25 = 26.1 cm², 5.5 X 8 = 44 cm²

The difference = 44 – 26.1 = 17.9 cm²

$$8. \div 10 = 0.8$$
$$8. \div 100 = 0.08$$
$$8. \div 1,000 = 0.008$$

Metric Conversions with Multiplication and Division

Notes:

| Multiplying by (0.1, 0.01, 0.001 …)	is equivalent to	Dividing by (10, 100, 1,000 …)
$2.5 \times 0.1 = 0.25$, $2.5 \div 10 = 0.25$	→	$2.5 \times 0.1 = 2.5 \div 10 = 0.25$
Multiplying by (10, 100, 1,000 …)	is equivalent to	Dividing by (0.1, 0.01, 0.001 …)
$2.5 \times 10 = 25$, $2.5 \div 0.1 = 25$	→	$2.5 \times 10 = 2.5 \div 0.1 = 25$

From the above, we find that:

– When converting from one measurement unit to another, you can use multiplication or division.

Ex. Note the corresponding figure:

– To convert from meters to centimeters, you can multiply by **100** or divide by **0.01**.

– To convert from centimeters to meters, you can multiply by **0.01** or divide by **100**.

X 0.01
4 Complete each conversion. Then, write a multiplication equation and a division equation with the same answer:

Ex. 45 mm = 4.5 cm	**a** 4.65 m = **465** cm
45 X **0.1** = **4.5**	4.65 X **100** = **465**
45 ÷ **10** = **4.5**	4.65 ÷ **0.01** = **465**
b 5.6 kg = **5,600** g	**c** 42 dm = **420** cm
5.6 X **1,000** = **5,600**	42 X **10** = **420**
5.6 ÷ **0.001** = **5,600**	42 ÷ **0.1** = **420**
d 0.02 L = **20** mL	**e** 235 m = **0.235** km
0.02 X **1,000** = **20**	235 X **0.001** = **0.235**
0.02 ÷ **0.001** = **20**	235 ÷ **1,000** = **0.235**

Dividing Decimals by Decimals

- Convert the divisor into a whole number: by moving the decimal point to the **right** (by multiplying by 10, 100, or 1,000...) according to the number of decimal places in the **divisor**.
- Move the decimal point to the **right** in the dividend by the same number of digits moved in the divisor.
- You may need to add **zeros** to the right of the dividend sometimes.
- Perform the division operation.

EX. Divide:

a $17.01 ÷ 0.7 = 24.3$

| ↓X 10 | ↓X 10 | ↑ |

$170.1 ÷ 7$

```
        024.3

     │    0
```

c $2.4 ÷ 0.025 = 96$

| X 1,000 | X 1,000 | ▲ |

$2,400 ÷ 25$

```

     │ ──────
     │   150
     │ - 150
     │ ──────
     │   000
```

Note:

Sometimes we may need to add a decimal point and an addition to complete the division process, as in the following examples:

1 When dividing $462 ÷ 12$, the quotient is **38** and the remainder is **6**, **so** we add the decimal point and 0 to the dividend to complete the division $(456 ÷ 12 = 38.5)$.

2 When dividing $97 ÷ 4$, the quotient is **24** and the remainder is **1**, **so** we add the decimal point and 0 to the dividend twice to complete the division $(97 ÷ 4 = 24.25)$.

Learn — Basic Order of Operations

Perform operations inside parentheses if any → Multiply or divide from left to right → Add or subtract from left to right

EX. Use the order of operations to evaluate the expression:

1. Perform the subtraction inside the parentheses. → $45 \div 5 + (9 - 3) \times 4$
2. Perform the division operation. → $= 45 \div 5 + 6 \times 4$
3. Perform the multiplication operation. → $= 9 + 6 \times 4$
4. Perform the addition operation. → $= 9 + 24$

$= 33$

1 Use the order of operations to evaluate each expression, one step at a time:

a $597.8 \div 6.1 + 13 \times 1.7$
= _____
= $98 + 22.1$
= _____
= 120.1

b $56.5 \times 2.3 - 15 + 12.7$
= _____
= $129.95 - 15 + 12.7$
= _____
= 127.65

c $82.43 \times 3.1 + 4.05 \div 0.01 - 2.5$
= _____
= $255.533 + 405 - 2.5$
= _____
= 658.033

d $90.7 + 116.6 \times 0.1 \times 2 - 20$
= _____
= $90.7 + 23.32 - 20$
= _____
= 94.02

e $(14.5 + 12.3 \div 0.01) - 9.8$
= _____
= $(14.5 + 1230) - 9.8$
= _____
= 1234.7

f $(45.42 - 17.11) \times (82.9 + 17.1)$
= _____
= 28.31×100
= _____
= $2,831$

Learn   Expanded Order of Operations

Operations within parentheses ( )	→	Operations within brackets [ ]	→	Operations outside of parentheses or brackets
1 Multiply or divide from left to right **2** Add or subtract from left to right		**1** Multiply or divide from left to right **2** Add or subtract from left to right		**1** Multiply or divide from left to right **2** Add or subtract from left to right

EX. Use the order of operations to evaluate the expression:

a Operations within parentheses ( ) → $3.5 \times [1.4 \div (7.5 + 2.5) - 0.04] + 2.84$

b Operations within brackets [ ]
① Division
② Subtraction
→ $= 3.5 \times [1.4 \div 10 - 0.04] + 2.84$

$= 3.5 \times [0.14 - 0.04] + 2.84$

c Operations outside of brackets
① Multiplication
② Addition
→ $= 3.5 \times 0.1 + 2.84$

$= 0.35 + 2.84 = 3.19$

2 Use the order of operations to evaluate each expression:

a $2.5 \div [0.5 \times (4.3 - 4.2)] - 2.4$
$$= 2.5 \div [0.5 \times 0.1] - 2.4$$
$$= 2.5 \div 0.05 - 2.4$$
$$=$$
$$= 47.6$$

b $[8.4 \div (3.6 + 0.4) \times 3] + 2.7$
$$= [8.4 \div 4 \times 3] + 2.7$$
$$= 2.1 \times 3 + 2.7$$
$$=$$
$$= 9$$

c $7.5 \times [4 - (7.6 + 2.4) \times 0.2]$
$$= 7.5 \times [4 - 10 \times 0.2]$$
$$= 7.5 \times [4 - 2]$$
$$=$$
$$= 15$$

d $[(2.5 - 0.1) \times (0.07 + 0.03)] \div 1.2$
$$= 2.4 \times 0.1 \div 1.2$$
$$= 0.24 \div 1.2$$
$$=$$
$$= 0.2$$

Notes: • Changing the order of operations leads to a change in the value.
• Note the following examples:

a $10 - 0.1 \times 1.6 + 2$
$= 10 - 0.16 + 2$
$= 9.84 + 2$
$= 11.84$

b $10 - 0.1 \times (1.6 + 2)$
$= 10 - 0.1 \times 3.6$
$= 10 - 0.36$
$= 9.64$

c $(10 - 0.1) \times (1.6 + 2)$
$= 9.9 \times (1.6 + 2)$
$= 9.9 \times 3.6$
$= 35.64$

3 Use the order of operations to evaluate each expression:

ⓐ $30 \times 2.5 + 47.18 - 3.12 \div 0.1$
= $\quad 75 + 47.18 - 31.2$
=
=

ⓑ $30 \times (2.5 + 47.18 - 3.12 \div 0.1)$
= $\quad 30 \times (2.5 + 47.18 - 31.2)$
= $\quad\quad 30 \times 18.48$
=
= $\quad\quad 554.4$

ⓒ $30 \times [2.5 + (47.18 - 3.12) \div 0.1]$

Learn **Writing Expressions to Represent Scenarios**

Note the following mathematical expressions:

Add	Subtract	Multiply	Divide
6.4 and 2.7	2.4 from 8.2	9.2 by 0.1	83.2 by 6.7
↓	↓	↓	↓
6.4 + 2.7)	(8.2 − 2.4)	(9.2 X 0.1)	(83.2 ÷ 6.7

Ex. Write an expression that matches the clues. Then, evaluate the expression:

Subtract 3.5 from 7.2 and divide the result by 10.

Parentheses are used if the first operation is subtraction or addition

$(7.2 - 3.5) \div 10$
$= 3.7 \div 10 = 0.37$

Multiply 2.5 by 0.1 and add 3.2.

No parentheses are needed if the first operation is multiplication or division.

$(2.5 \times 0.1) + 3.2$
$= 0.25 + 3.2 = 3.45$

Multiply 217 by 0.01 and subtract the result from 4.8, then divide by 10.

$(4.8 - 217 \times 0.01) \div 10$

$= (4.8 - 2.17) \div 10 = 2.63 \div 10 = 0.263$

Parentheses are placed to perform subtraction before division, and parentheses are not placed for multiplication because it is natural that it is performed first.

4 For each problem, write an expression that matches the clues. Then, evaluate the expression:

ⓐ Subtract 3.1 from 4.62. Then, multiply the result by 2.

$$(4.62 - 3.1) \times 2 = 3.04$$

ⓑ Divide 93 by 0.3 and then add 114.7. After that, divide the result by 5.

$$(114.7 + 93 \div 0.3) \div 5 = 84.94$$

ⓒ Add 30.4 , 87 and 17.5. Then, subtract the result from 224.7. Multiply by 100.

$$[224.7 - (30.4 + 87 + 17.5)] \times 100 = 8,980$$

ⓓ Multiply 7.6 by 100. Next, subtract 34.3. Then, add 12.4. Finally, divide the result by 0.1.

$$(7.6 \times 100) - 34.3 + 12.4) \div 0.1 = 7,381$$

Find the difference between 10 and 9.27. Multiply by the sum of 54 and 46. Then, divide 1,168 by the result.

$$1.168 \div [\,(10 - 9.27) \times (46 + 54)] = 16$$

5 For each problem, write an expression that matches the scenario. Then, evaluate the expression:

a Kamel is saving money to buy a mobile. He currently has 1,000 LE. He begins working two jobs. At his first job, he saves 50 LE a week. At his second job, he saves 30 LE a week. He saves the money from his jobs for 4 weeks to add to his savings. How much does Kamel have saved at the end of the 4 weeks?

$$1,000 + (30 + 50) \times 4 = 1,320$$

b Mounir is lifting weights to help train for an upcoming competition. He attaches 4 weights to his bar, a pair of larger weights and a pair of smaller weights. Each large weight has a mass of 33.75 kilograms and is 17.5 kg heavier than each of the smaller weights. Together, the four weights have a mass of 100 kg. What is the mass of one of the smaller weights?

$$(100 - 33.75 \times 2) \div 2 = 16.25$$

Numerical Pattern

It is a sequence of numbers according to a certain rule.

Pattern rule is the relationship between the number and the number before it.

EX. Note the following patterns:

$$3 \xrightarrow{+3} 6 \xrightarrow{+3} 9 \xrightarrow{+3} 12 \xrightarrow{+3} 15 \xrightarrow{+3} 18 \xrightarrow{+3} 21 \; , \; ......$$

Each number = the previous number + 3

The pattern rule is: **n+3** (the variable n represents the **previous number**)

$$2 \xrightarrow{X2} 4 \xrightarrow{X2} 8 \xrightarrow{X2} 16 \xrightarrow{X2} 32 \xrightarrow{X2} 64 \xrightarrow{X2} 128 \; , \; ......$$

Each number = the previous number X 2

The pattern rule is: **n X 2** (the variable n represents the **previous number**)

6 Write the **rule** for each pattern with a variable. Then, complete the pattern by finding the missing **values**:

5 Answer the following:

1. A bakery made **140** servings of baklava for a party. If each baking tray holds **12** servings of baklava, how many trays will be needed to hold all the baklava?

$$140 ÷ 12 = 11 \text{ (R8)} → 12 \text{ trays are needed}$$

2. In one year, a textile factory used **11,650** meters of cotton, **4,950** fewer meters of silk than cotton, and **3,500** fewer meters of wool than silk. How many meters of fabric were used in all?

$$\text{Silk} = 11,650 - 4,950 = 6,700 \text{ m}$$

$$\text{Wool} = 6,700 - 3,500 = 3,200 \text{ m}$$

$$\text{Total} = 11,650 + 6,700 + 3,200 = 21,550 \text{ m}$$

3 An architect is designing a bridge. The architect has two choices for materials. Mighty Steel sells 5 metric tons (t) of steel for 100,000 LE. Silver Strong Steel sells 3 t of steel for 70,000 LE.

If the architect needs 15 t of steel, how much money will be saved by purchasing from Mighty Steel?

Mighty Steel: 3 X 100,000 = 300,000 LE

Silver Steel: 5 X 70,000 = 350,000 LE

Money saved = 350,000 – 300,000 = 50,000 LE

4 Zeinab ordered 12 packages of fabric squares to make a quilt. Each package has 18 fabric squares, and Zeinab used all the squares for her quilt. Reem made a quilt that was 13 squares wide by 13 squares long. How many fewer squares did Reem use than Zeinab for her quilt?

Zeinab used = 12 X 18 = 216 squares

Reem used = 13 X 13 = 169 squares

The difference = 216 – 169 = 47 squares

5 Nagi sold a total of 30 boxes of sports T-shirts at his store on Monday. These boxes contained only basketball T-shirts and football T-shirts. Each box contained 25 sports T-shirts. He earned 3 LE for each sports T-shirt he sold. He earned a total of 1,134 LE from the football T-shirts he sold. How much money did Nagi earn from the basketball T-shirts he sold?

Profit: (30 X 25) X 3 = 2,250 LE

Basketball = 2,250 – 1,134 = 1,116 LE

6 Malek and his family are going on a road trip to his grandmother's house, which is 465 kilometers away. On Friday, they traveled 124 km. On Saturday, they traveled 210 km. How many kilometers will they need to travel on Sunday to reach his grandmother's house?

The distance = 465 − (124 + 210)

= 465 − 334 = 131 km

7 If the total price of 25 books is 1,875 pounds, what is the price of 36 books?

The price of one book = 1,875 ÷ 25 = 75 pounds

The price of 25 books = 36 X 75 = 2,700 pounds

8 Hussam bought a car and paid 85,500 pounds as a down payment (part of the price), and the rest of the car's price is paid in 24 equal monthly installments. If the total price of the car is 163,500 pounds, what is the value of each installment?

The remaining money = 163,500 − 85,500 = 78,000 pounds

Value of each installment = 78,000 ÷ 24 = 3,250 pounds

9 A school has 456 boys and 419 girls. It is intended to divide boys and girls equally into 25 classes in the school. How many students will be in each class?

Total number of students = 456 + 419 = 875 students

Number of students in each class = 875 ÷ 25 = 35 students

10 A rectangular garden with dimensions of 124 meters by 85 meters, divided into rectangular planting basins, each of which is 62 square meters. How many basins are in the garden?

The area of land = 124 X 85 = 10,540 square meters

The number of basins = 10,540 ÷ 62 = 170 basins
